

# CatchDes.txt

The file is located in the [modeldir](#) folder. The file is used for the calculation of regional estimated parameters by regression. This is used when model option `regestimate` is set in [info.txt](#). This file contains catchments descriptors used in the regression.

The first row of the *CatchDes.txt* file gives the number of catchment descriptors (number of columns in coming rows). Then follow one row for each subbasin (in the same order as in [GeoData.txt](#)  ) with the values of the descriptors for the subbasin. No column heading or subid is given. The first column is always 1.0 and serves as an intercept in the regression equation.

Example snippet of a *CatchDes.txt* file structure:

```
3
1.0 23.3    0.003
1.0 20.9    0.001
...
```
